## Book Descriptions:

# Craftsman Glue Gun Manual

Examine the glue gun. Locate the metal rest. Locate the trigger. This is just behind the barrel on the underneath side of the gun. It should be a solid piece of plastic shaped like a slice of pie. Just above the trigger, is the barrel loader. This is where the glue sticks go into the gun. Inside the barrel loader there is a smaller round piece of plastic. This is what actually pushes the glue stick through the barrel. Pull the trigger and watch the piece of plastic move with it. Pick up the electrical cord and examine it. Make sure the prongs are secure and not bent. Make sure the cord has no breaks in the outer lining and there are no frays at the base of the gun where the cord attaches. Plug the glue gun into the electrical outlet. Allow the gun to heat at least 15 minutes so it reaches operating temperature. When the gun has heated at least 15 minutes, insert a glue stick as far as it will go without forcing it. Now pull the trigger until a small drop of hot glue forms on the tip of the gun. Practice gluing on the paper plate. Pull the trigger until a ball of glue forms on the plate. Release the trigger and quickly press the tip of the gun down onto the surface of the plate and pull it to the side. This will break the glue and stop it from stringing out when you pull it away. Continue practicing until you get the right amount of glue you want for the object you imagine using. When you pull the gun away, there may be a small string but this will break off easily. When you have the perfect amount of glue and only a tiny string forming when you pull away, you are ready for your project. The fit may be tight. The more wax you use, the smoother the fit. If it comes away and the wax is still quite soft, wait a little longer before pressing the seal down. A test area would be my first idea; color fastness and while there is not much odor it may affect some people with allergies and respiratory problems. <http://nuptini.com/userfiles/nuptini/bubble-bobble-2-manual.xml>

It will take some time but be careful not to saturate the carpet itself just the immediate area; the alcohol may breakdown adhesives bonding the carpet fibers to the backing or seaming tape on the underside. Most likely in the feeding mechanism, try to heat it up, the unplug, and use like a paper rolled up to try to remove some of the glue. Unlike other adhesives, hot glue goes on smoothly, dries fast and holds firm when applied to all sorts of different surfaces. While its hold is not the strongest, it can be used to bond a greater diversity of materials than almost any other glue. Using a hot glue gun is a breeze as long as you follow a few basic steps and keep safety guidelines in mind. Go over the owners manual for information about safely operating your glue gun. Take note of the different components of the glue gun and how theyre supposed to function. The instruction manual should be able to tell you whether your glue gun will begin heating up automatically or needs to be turned on and off, how long it typically takes to warm up, and what materials its recommended

Before plugging in or using the glue gun, look over the body to check for cracking, splitting, chipping or any other indications of damage. Make sure you also take a look at the electrical cord to see if there's any frayed or broken wires. There should be a clear path for the melted glue to emerge from the tip of the glue gun. If necessary, remove the nozzle and wipe it down with a piece of aluminum foil to take off dried glue, or use a toothpick to clean out the hole. In the worst case scenario, you may simply have to wait until the glue gun warms up enough for the old stuck on glue to drip off. Take a fresh glue stick and place one end into the circular opening in the back of the gun. Slide it in until it stops. If there is already a partially used glue stick in the gun, finish that stick before inserting a new one. Check the instructions or specifications of your glue gun when buying replacement glue sticks just to be on the safe side. Locate an electric outlet in the wall nearest to where you'll be working on your project. Stick the glue gun's electric cord into the socket. The glue gun's heating element will automatically begin to warm the glue stick inside, so don't touch the nozzle or leave the glue gun unattended once it has been plugged in. A cord in bad condition can present a possible fire risk. If you can't find one of these, try using an extension cord to increase your range within your work area. Give the glue gun a couple minutes to soften the glue. Once it's been sufficiently melted, the glue will ooze out when you pull the trigger. For most glue guns, the heating process will take around two minutes. Aim the nozzle of the glue gun downwards and place it close to the item you'll be gluing. Gently squeeze the trigger of the gun until melted glue begins to emerge from the nozzle. Glue directly onto the item's surface, leaving the nozzle in contact. Start with a modest amount of glue and then determine whether you need more. A little glue goes a long way.

The melted glue will flow fairly quickly once the trigger is pulled, and it can be easy to use too much if you're not careful. Avoid saturating the item you're gluing or applying the glue in messy globs. Remove the nozzle from the item you just finished gluing. Allow the glue to dry for several minutes. The bond between the glued surfaces will solidify as the glue sets up. Make a home in your toolbox for a glue gun when performing minor indoor repair jobs. Hot glue works especially well on wood and plastic objects in cool, dry conditions. Big jobs should always be carried out by contractors using the proper tools. The next time you're helping your kids with a school project or putting together homemade holiday decorations, reach for the hot glue gun instead of the Elmer's. It's better for a larger variety of surfaces, goes on cleaner and won't cause paper to wrinkle and colors to bleed the way some craft glues do. Make sure that the measurements, angles and dimensions of your craft project are perfect before gluing it down. Hem an illfitting pair of pants with a ring of hot glue, or use it to reattach a button that's popped off. Unlike many types of bonding materials, hot glue is actually quite successful on fabrics. It will work best, however, on parts of clothing like buttons, zippers and other functional features. Because of its thick, gel-like consistency, hot glue works better for sticking thin, easily damaged surfaces together than more liquid adhesives like paste and even superglue. Watery glues can be difficult to apply, require longer to take effect and have a higher chance of damaging sensitive materials than hot glue. Hot glue is also versatile, and will often hold together temperamental objects that don't take well to other types of adhesives. I tried to pull the glue stick out, but unfortunately my glue stick broke inside the gun.

He has been a construction professional since 1987. If you need a permanent, longterm adhesive for fabric, leather cement can be good, especially for affixing embellishments to fancy costume designs for theater, etc. The recommended type of glue gun for use with fabric is a low temperature one or you can use an adjustable temperature glue gun

set to low. It is important to use the low temperature, to prevent burning the fabric; you'll also need to use low temperature glue sticks or alltemperature ones. Always test a small piece of fabric first, to check it works well and use the usual safety precautions when handling the hot glue gun and glue. Do not use coolmelt glue sticks in a hotmelt glue gun. To fix this problem, use a hair dryer on the strings. A quick, short blast of the hot air will melt away the strings. Only do a short heating, as leaving it too long might melt the rest of the glue you've just added. If you'd rather rub off the strings, use rubbing alcohol or clear alcohol and a bit of paper towel to rub the strings away from the craft project; you can let the strings soak briefly in the alcohol before rubbing away if the glue is stuck. Always turn the glue gun to the Off position when not in use. This means you may want to find another way to repair a chipped coffee mug or reattach the soles of your summer sneakers. Then, aim the nozzle close to the item you're gluing and lightly squeeze the trigger to release the melted glue. You can apply the glue smoothly in dots, swirls or straight lines. A little goes a long way, so use the minimum amount of glue required. Let the glue dry for several minutes, and don't forget to unplug the gun when you're finished. But what do you do if your favorite glue gun in your tool arsenal malfunctions? Some glue gun problems — especially those involving an industrial model — require a trained expert. Other issues are relatively simple to fix if you have some degree of knowledge about your glue gun and how it operates. Others will void the warranty if you disassemble the machine and determine it was a factory defect. Depending on the type of adhesive you use, some will operate at relatively low temperatures while others require much more elevated temperatures. There are even dual temperature guns so you can tackle a variety of projects with one gun. Even if the parts are available, the additional time, materials and hassle involved indicate you should opt for replacement.

<http://dkc1burgas.com/images/brother-p-touch-pt-1880-label-maker-manual.pdf>

If a problem develops, it would be worth trying to determine what is causing the issue first, and perhaps sending it to us to have an expert determine whether the problem can be fixed. Check the manufacturer's manual or call an expert to find out what sort of glue sticks may be incompatible with your machine. Refer to the manufacturer's instructions on types of glue to use with your glue gun. This can prevent the flow of adhesive and cause a pressure buildup, inducing back melt. Back melt will foul the interior of your gun. If this is the case and you leave the gun plugged in and heated, the glue will start to leak from various points on the gun. Check and ensure you are using the correct type of glue stick for the gun. The glue may have jammed and charred, making the nozzle appear as if it has gone bad. You may need to adjust the flow control valve if there is one or the air pressure. If your gun stops working entirely despite being plugged in and turned on, check your battery or power supply. The nozzle's O-rings break or the threading gets worn causing a leakage. If you don't, you may strip the nozzle threads, causing a permanent leakage issue and possibly damaging the equipment irreparably. Don't over tighten, but ensure it is snug and doesn't move. Often it is not cost effective to repair a lowcost model. Sometimes cleaning the mechanism

will solve the problem, but if the problem persists after cleaning, replacing the mechanism costs much less than a new machine. The kit has a valve assembly, nozzle, end clip, insulation and handle screws. Whether it is a thermostat or the TCO that failed, you must replace both, as they are part of the same unit. You need to take special care when disassembling and fixing the equipment. Some hot glue guns have special screws to keep the casing locked and together. You may need to purchase a special tool, as standard flat tip and Phillips head screwdrivers won't work.

Chances are if you need to repair a glue gun, you have already been using it for some time. Glue may have built up along the seals through leakage or carelessness. Use alcohol to remove the glue so the casing doesn't crack or break when you remove the screws. Once you do so, you can remove any retainer or other parts. This is particularly useful if you use pneumatic guns and bulk hot melt machines. Remove melted glue from around the nozzles after each use. Visually check for signs of adhesive char. Adhesive char forms when the adhesive properties of the glue change due to thermal and oxidative degradation. Basically, the adhesive overheats and clogs the lines and the gun machinery. We can advise you as to what may be the cause of your troubles and a possible fix. Please provide us with the make and model number of your glue gun, along with the date of purchase so we can check if your equipment is covered under warranty. From high volume to detail work, 3M Hot Melt Applicators ensure optimum performance through melt on demand or progressive feed technology to meet your production deadlines. The piston can be retracted and adhesive glue sticks loaded into the chamber to keep production flowing. Applicator includes stand and 9921 and 9946 brass tips. An anti tip guard swings down from the front to prevent it from tipping. As a result, they often exceed 100 psi shear strength for quick, convenient assembly without volatiles. Hot melts provide nearly instant bond, and are used on a wide variety of materials ranging from wood to corrugated cardboard, heat sensitive foam, plastics and metals. Unlike mechanical fasteners or sealing tapes, hot melt adhesives are virtually invisible between mating surfaces. From high volume to detail work, 3M Hot Melt Applicators ensure optimum performance through melt on demand or progressive feed technology to meet your production deadlines. New, high output, trigger operated, hot melt adhesive applicator for manual packaging and product assembly applications. Offers improved light weight design and contoured grip for operator comfort and precise control.

Unless specifically stated on the product package or applicable product literature, 3M industrial products are not packaged, labeled, or intended for sale to individual consumers ie., the general public. Debbie 3.0 out of 5 stars When we did side by side tests to see if there were any differences, there arent. Literally identical in every way from the look, heat up time and temperature output. For those of you who are curious, the Adtech tips fit on this gun. since theyre identical. Its almost twice the size of the craft store guns, but handles easily. Its stable on the workbench and doesnt drip. The trigger grip fits your whole hand and glue delivery is smooth and controllable. The fold down front foot is wide, heavy, and stable. The included wide distance rear wire foot clips on, but is unnecessary. It would get in the way for many of my tasks. The line cord is grounded, 3 wire, industrial strength, with a strain relief at the gun end. I recommend this gun to anyone who doesnt like disposable tools. It heats quickly and works exactly the way you would want it to. The several other reviewers that state very slow warmup are accurate. Even after 20 minutes you must force the stick threw the gun then it seems to be ok for awhile. Something is WRONG with the design of this gun I feel. It heats up to a

lower temperature now and pumps out glue a bit slower, however it still works very well for what I am using it for and it is as well several years old. Over the years Ive purchased two more and I recommend it to multiple people. The temperature of the glue can get very hot and burn you if you are not careful.

It works significantly better than craft store glue guns and I highly recommend it if you are looking to upgrade. Long, skinny snout fits into tight places, heats quickly and does not leak or drip once in use. I forgot to unplug it overnight and I was surprised there was no mess in the morning. Somehow it prevents glue from melting unless you pull the feed trigger. Comes with 2 removable bench stands to pick from. I removed the rear one as the front one supports it fine plus folds back when it might be in the way. The rear stand is more stable but I found it got in my way too often. The large, long feed trigger allows precise feed control for small glue jobs. I would not recommend using cheap glue sticks however as I suspect they are what causes the leaking problems posted in other reviews. I ordered the Surebonder 725R510 sticks with the gun and no probs. The initial warm up time is ok and once the gun has reached operating temperature it flows nicely and delivers as much glue as I need. The handle is comfortable to hold and the trigger is easy to operate. I did however discover that this same exact gun is available under the brand and model Ad Tech PRO 200 glue gun and is much cheaper than the 3M branded gun. It does not drip and it has a nice stand to keep it upright, heats up quickly in about three minutes and is reliable. If you are looking for a nice glue gun for your production, get this model, you'll be glad you did. The 3M Glue Sticks brand also has low to no solvent odors so odors is not going to be a problem and it can be used in the home I tried it in my home. A slight odor on initial firsttime start up, but there was no odor after using it after this. You pay a bit more, but the quality, performance and longevity is well worth it. This glue gun performs as well as very expensive brands that costs hundreds of dollars. I was pleasantly surprised by this 3M product. This ScotchWeld gun is everything I was looking for.
